PRODUCED BY H.V.V.Z.U.G. - -

2 — MY POINT OF VIEW

Welcome to our Anniversary Issue of Hunter Valley VZ Journal. Boy, it's been a hectic first year but we made it thanks to a lot of people who stayed with us through the good times and the bad. I think the regular contributors can be proud of their work in the last twelve months and because of them there are a lot more enlightened VZ users hovering over keyboards all over the country. So Dave Boyce, Robert Quinn, Dave Mitchell, Bob Kitch, Larry Taylor and all those who played a part in the first year the Hunter Valley VZ Users' Group sincerly thanks you and hope you continue the support and high standard you have set.

When we started this Journal we thought of it as a service to our local members, but it seems we hit a winning streak by trying to keep it simple and readable and not too technical. We now have subscribers from all over Australia and New Zealand. Most of the credit for the layout of this Journal belongs to the two Editors we have had during the year. They both have their own styles and ideas and they both put their blood, sweat and tears into the job. Thanks a lot fellers.

Over the past year the Presidents Report has roasted a few people and praised a few and generaly tried to keep Tricky Dicky honest, but alas, I have also put my cloven hoof in my cavernous mouth on the not so seldom occassion and the hot water I got into tended to burn a bit. Having no more fingernails left (for the purpose of slipping burning bamboo slivers) I have decided not to torture our readers any longer so there will be no more reports of this nature from Me (please stop cheering it hurts my ears). Instead you may have to read the Editors comments as his fingernails are intact.

Well now, we've thanked everybody and his brother and now it's time to thank the most important person of all, you, for without your support we could not produce this Journal. We will ask one favor of you though, write to us and let us know what your problems are or what you would like to see in this Mag (Journal, thank you Ed.) as it makes life easier for us if we know what you want. We also dont mind a bit of constructive criticism (put in a nice way of course), so please, give us some feedback and we might have an even better Journal. Now dont forget, your subscribtion is now due for renewal and if you were pleased with the Mag up untill now, in the words of the prophet you aint seen nothin' yet.

You will no doubt notice that the Journal now has printing on both sides of each page, this is because we now have access to a Photocopier and so while the Journal looks thinner it has just as much content if not more and with no loss of quality. This allows us to add more features and pages if we wish to without increasing postage costs.

Recently we had the chance to put on a display at the local Computer Exhibition which we gladly accepted. Considering the short notice (three days) we managed to stage a good show which attracted a fair amount of attention. The increase in VZ sales in the Hunter Valley during the next month or so will be due to our efforts.

Till next time then, bye now.

P.ELLIS (PRES)

EDITOR'S COMMENTS - - - - - - - - 3

MY POINT OF VIEW by Peter ELLIS :- Page 2
Our President recaps on the year gone by with a sense of humour and tongue in cheek.

BYTE BACK :- Page 4
The nibbles keep coming with some tips as well from R.QUINN.

EDITORIAL - COMPUTER SHOW - VZ USER GROUPS :- Page 5
Normally I don't write Editorials but it's about time I thanked a few people for their help and support.

FOR SALE - QUICKWRITE (C) DISC BASED W.P. PROCESSOR :- Page 6
This full featured W.P. is ONLY available from VSOFTWAREZ.

HINTS & TIPS and WANTED TO BUY :- Page 6

BOOLEAN LOGIC OPERATIONS by Bob KITCH (C) :- Pages 7-9
This is an Educational game designed to make you think.

IMPROVING EBSV2.3 by Dave MITCHELL :- Page 9
Just by a few POKES you can modify EBSV2.3 to work with any Routine located at 6000-67FF HEX.

FOR BEGINNER'S by Andrew LAIRD :- Pages 10-11
With this issue we welcome Andrew as a new Contributor to our Journal and hopefully a new member as well.

SIDEWAYS by Dave BOYCE :- Page 11
A simple subroutine to print out HI-RES screens on your Dot Matrix Printer, Sideways, see back page for an example.

ZERO POWER RAM by Joe LEON :- Page 12
You can throw away your Eproms and just use a 2k RAM with built in lithium batteries and modify your routines anytime.

FOR SALE - EXTENDED DOS V1.0 (C) :- by Dave MITCHELL Page 13
I can recommend EXTDOS R/E to anyone with a drive as it's one that's hard to be without. It makes life that much easier.

USING DISC TOKENS by Robert Quinn :- Pages 14-15
This article is an addendum to Understanding Your VZ series with more to follow. You can use them to call your M/L routines.

MAKING CARTRIDGE WORD PROCESSOR WORK by Joe LEON page 16
If your VZ and or Drive act crazy with the Cart. W.Processor then this article may help sort out the problem.

FOR SALE - E & F TAPE W.P.PATCH (C) :- Page 17
Owners of E & F Tape W.P. who have a Drive may find our Tape to Disk conversion W.P.Patch an attractive buy.

ENHANCING VZ BASIC Part 2 by Larry TAYLOR Pages 18-19
Although in basic the listing more closely relates to the assembler version for ease of understanding.

AEM4505 SPEECH SYNTHESISER By Dave BOYCE :- Page 20
Dave explains how to convert it for VZ use. Due to lack of space driving software is held over till next issue.

BELIEVE IT OR NOT :-
In Japan you can buy just about anything, including Fish and Sea Moss (CMOS) Chips. D.Boyce.

4 — BYTE BACK

Scott Le BRUN - The newsletter is good stuff! The Ram communication addresses are extremely useful. Also Bob Kitch's article (Rom Inv. Char. Set) was very interesting. BUT the article concerning the Magic VZ Eprom is very misleading. The extra Disk "Commands/Functions do not exist in ROM. All this utility does is enable the Basic Interpreter to recognise those particular words. If you try and execute the commands, all you get is an ERROR message. Please correct me if I'm wrong.

Editor (OUCH) - First I would like to thank you for your compliment re the Journal, also I'm sure both Dave and Bob appreciate your comments re their articles. As for the criticism re Magic Eprom I thank you for caring enough in making your comment to what you thought was a very misleading article. As I'm both the Editor and Author of the article hopefully I'll be able to answer to everyone's satisfaction as it is never our intention to be misleading.

I'll quote part of the offending article from issue 8/9, page 11, paragraph 2. "This gives you 19 additional commands/functions and all the disk command exits which are very handy to link any M/L programs".

The key words which I feel you may have missed is "disk command exits". You are quite right in saying the routines do not exist in ROM, exept for SAVE, LOAD, NAME and KILL which are in the Magic Eprom and are used for fast SAVING, LOADING, RENAMING and KILLING of ARRAYS. The rest of the disk command words/exits can be used to link your own M/L rotines. I'll let Robert QUINN'S article on "USING DISK TOKENS" in this issue inform you on how this can be accomplished, thanks Robert. I hope the above has cleared things to everyone's satisfaction.

NOTE :- Since writing the Magic VZ article I've become aware that Steve Olney's and W.Obrist's Extended Basics are not fully compatible. Apparently they use some of the same Tokens for different commands/functions. More on it it in a future issue.

Robert QUINN - I like your Editors Comments page in the Journal. It's well set out for easy reference to the contents. Robert has also supplied some additions to the Ram Communication Addresses which are listed below. Thanks for the compliment and additional information Robert, much appreciated, Ed.

ADDITIONS TO RAM CUMMUNICATION ADDRESSES :-

30780-2	CHARACTER BYTE @ CURSOR POSITION
30889	0 IF CASSETTE INPUT ELSE NON ZERO
30931	LENGHT OF LAST DEFINED STRING
30945	AUTO INPUT FLAG 0=NO AUTO
30943-4	POINTER TO START OF PROGRAM WHEN RUN
30956-7	LINE NO. FOR BASIC LINE ENTERED/DELETED
30965-6	NUMBER OF LINE PROGRAM RUN ENDS ON
30967-8	POINTER TO ADDRESS OF LAST MEMORY CELL SCANNED FOLLOWING BREAK, STOP OR END

NOTE :- We welcome and appreciate your feedback, be it compliment, criticism, hints and tips or requests for help, so keep them coming.

The annual index has been held over till next issue.

As Editor I've made many contacts all over Australia and New Zealand and of course locally and am keeping in touch with many of them. One thing I found that most were more than willing to help out when asked, even when the help requested took a lot of their time and effort. So my special thanks go to Dave Boyce, Dave Mitchell, Robert Quinn, Larry Taylor and Bob Kitch. Of course there were many others who helped out as well. And I'm especially thankful to our Comittee who gave help and support when needed. They showed me what teamwork is all about.

HUNTER VALLEY VZ USERS' GROUP AT NEWCASTLE COMPUTER SHOW :-

Great teamwork and many long tiring hours by the committee enabled us to put on a good show at short notice. Our aim was to attract new members to our club and new subscribers. Also to advertise the fact that there was support for the VZ not just locally, but Nationally as well. How succesfull we were in our efforts we wont know for a while, but we had some feedback already so we could'nt have done too bad a job of it.

Our display consisted of HI-RES slide shows, demonstrations of Dave Mitchell's Extended DOS, our Word Processor Patch and a few other programs and our Journal was for sale at the show too. WE also had on display other VZ publications, LE VZ OOP, VZ USER and VZ DOWN UNDER so prospective subscribers could chose a publication according to their needs.

There was no question about it, the VZ was the cheapest Computer at the show and a lot of people were surprised at it's capabilities. Many people came to the show to select a computer and first time buyers found the VZ very attractive because of the big price difference between the VZ and next cheapest.

One of the most surprising things we learned at the show was the respect other exhibitors at the show held for the VZ even though the computer systems they were demonstrating cost many hundreds if not thousands of dollars.

OTHER VZ USER GROUPS AND PUBLICATIONS :-

VZ USER	MARK HARWOOD	P.O.BOX 154	DURAL N.S.W. 2158
LE'VZ OOP	J.C.E. D'ALTON	39 AGNES St.	TOOWONG QLND. 4066
VZ DOWN UNDER	C/- GEORGE SEGGIE	P.O.BOX 316	ST.KILDA VIC. 3182
VZ-LINK NEWSLETTER	P.O.BOX 1972	C.P.O.	AUCKLAND NEW ZEALAND
VZ USERS GROUP	P.O.BOX 22-094	CHRISTCHURCH	NEW ZEALAND

NOTE :- When writing to any above or H.V.VZ. Users' Group for information please enclose a S.S.A.E.

6 FOR SALE — QUICKWRITE

* * * NEW * * * NEW * * * NEW * * *
QUICKWRITE WORDPROCESSOR - DISC BASED WORDPROCESSOR A$40.00
QUICKWRITE WORDPROCESSOR IS SUITABLE FOR THE EXPANDED VZ200/300.

QUICKWRITE is software on disc, so RAM and ROM PACKS do not have to be plugged into the VZ which can cause loose port socket connections. QUICKWRITE runs on either the LASER or VZ DOS disc controller. QUICKWRITE saves/loads document text (data) to disc.

FEATURES :-
* Fast disc saving and loading of document text (data).
* Automatic periodic saving of data while in typing mode if required.
* Tape saving and loading of data as a backup medium.
* Loading of E & F tape files (data) possible.
* Printer font changes within the data.
* Capitals/lower case software lock on/off.
* Acommodates wide printers - up to 255 columns.
* A printer/Plotter can also be used.
* Four print justify/wragged modes.
* Adequate operator warnings.
* Labelling of discs allowable, such as date, code, etc.
* The usual editing facilities:-
  Delete, Insert, Find and Replace, Paste, Cut.
* Number 1 or number 2 disc drive selection allowed.

The price of A$40.00 includes surface postage within Australia.
Sold ONLY by VSOFTWAREZ 39 AGNES St., TOOWONG
Q/LAND. 4066. AUSTRALIA

HINT AND TIPS

REJUNIVATING PRINTER RIBBONS :-
Persons using their Dot Matrix Printers a lot find they are forever buying printer ribbons which can become a bit expensive. The life of your printer ribbon can be extended a fair bit. When the printing starts getting a bit faint then it's time to reach for a can of W.D.40 or something similiar.

The technique is simple. First remove printer ribbon from printer and upon examining the case you will notice that the case is made up of of two sections, the case and lid. Using a small kitchen knife prise the lid off being careful not to spill the ribbon on the floor or damage the case as it's fragile. There are two types of ribbons, one has a felt type roller with a small endless loop while the other has a long endless loop with no roller.

Spray the ribbon or roller with W.D.40 being careful not to overdo do it as too much W.D.40 can wash the ink out of the ribbon or roller. Reassemble and your printout should be nice and dark again. W.D.40 may not work with all ribbon types, EG. Carbon, cloth type work OK though. It's possible to reink your ribbon as well using stamp pad ink but I have'nt had much sucess with it so far.

WANTED TO BUY

IMPROVING EXTENDED BASIC - - - -

IMPROVING THE EXTENDED BASIC PROGRAM (EBSV2.3) BY D.MITCHELL

The extended program is a very well written program. It can however be improved so it can be used with other extended basics or extended dos. The trouble is it jumps to the DOS interpreter hence no other will work with it but by adding a further six bytes to the program will enable us to do this.

```
BLOAD"EBSV2.3"

7AFA 2A 04 78   LD HL,(7804H)
7AFD 22 3D 7C   LD (7C3DH),HL

31482 42  4 120
31485 34 61 124
```

The easiest way to add the above to the program is by POKING.

```
POKE31482,42:POKE31483,4:POKE31484,120
POKE31485,34:POKE31486,61:POKE31487,124
```

Now all that has to be done is save the program.

```
BSAVE"EBSV2.3",7AFA,8071
```

The modification will work with any program/routine located at 6000-67FF Hex, but not with programs that are top of memory seeking.

10 — FOR BEGINNERS BY ANDREW LAIRD

SYNTAX ERROR :-

The SYNTAX ERROR is the chief bugbear of beginners and experienced programmers alike. The first error we experienced was more than likely the SYNTAX ERROR. It is the most common error to be found in BASIC programs. A SYNTAX ERROR occurs when the BASIC interpreter either doesn't recognize a "word" or can't make sense of a sequence of characters. (The BASIC interpreter is the program which converts - interprets - your BASIC program into a form directly understood by the computer. It is part of the program contained in ROM.) In other words, a SYNTAX ERROR occurs when you make a typing error, spelling mistake, don't match your parentheses ("()"), or use incorrect punctuation. For example, typing "PRIMT" instead of "PRINT" will cause the dreaded response "SYNTAX ERROR" to leap onto your screen.

However, the "GOOD" thing about SYNTAX ERRORS is that they are the easiest to remedy. When RUNning a program, a SYNTAX ERROR calls a halt to proceedings and outputs its error message. The important part is that we are told in which line the error ocurred. Here's what to do about it:-

LIST the line causing the problem (LIST. will do this for you) and look at it carefully. First, check for typing and spelling mistakes. Often, "1" and "I", "0" and "O" will have been confused. Next, search for unmatched parentheses. Finally, make sure that the punctuation is correct - for help in this respect refer to the VZ Basic Reference Manual, in particular, to pages 161 - 166, or to the examples throughout the manual. If none of this works, find a friend who knows more than you do and ask for help.

Here are a couple of ways to guard against SYNTAX ERRORS creeping into your program in the first place. One of these is to learn how to touch-type, which will be useful to you in more than just getting your programs to run. The reason this will cut down on SYNTAX ERRORS is that you watch the screen rather than the keyboard when typing. For those of us with VZ-200's, the old keyboard should be replaced with a decent one (see VZ Journal issue 5 for information on how to do this). If you can't or won't take this option, then start using the CTRL and CTRL-RETURN key combinations if you don't already (eg use CTRL-Q to get "FOR", use CTRL-RETURN-F to get "RND("). Not only do they limit your typing and spelling ERRORS, but once you learn where to find them, it makes life that much faster.

To finish off, I'd like to make the comment that there's nothing like practice when it comes to spotting errors. Don't forget, there's nothing you can do at the keyboard which will destroy your computer. In the light of that, I present an exercise to try your skill.

EXERCISE :-

Free the following program from SYNTAX ERRORS. One way of doing this exercise and checking if you are right would be to enter it into your computer and keep going until the program runs.

```
10 CLZ
20 MODEO
30 COLOUR 3,O
40 INPUT"GIVE ME TWO NUMBERS,A,B
50 C=(INT(A)*22-B+1I
60 PRIMT A;B;C;C*C
70 MODE 1
80 FOR X=0 TO 20:FPR Y=1 to 30
90 SET (X:Y)
100 NEXT Y,X
110 GOTO 10
120 END
```

NOTE :- The first Person to submit a SYNTAX free version of above program to the EDITOR will have it published in next issue, so get your thinking caps on and get going, (Ed.).

SIDEWAYS BY DAVE BOYCE - - - - -

This Sub-routine READS the HIGH Resolution (Mode 1) SCREEN from the Bottom to the Top and from Left to Right. As it reads the screen, it Prints it to the Dot Matrix Printer. The result is the screen being Printed DOWN the page instead of ACROSS the page. E.G., like turning your screen on it's Right Side.

The Dot Matrix Printer should respond to ESC Code 27 for this Sub-routine to work. If your printer uses different ESC Codes then change the ESC Code 27 in lines 15060 and 15150 to one used by your printer.

In use your program would after the HI-RES screen is drawn send it to the sub-routine via a GOTO or GOSUB to line 15060. After the printout is finished line 15160 should send it back via a GOTO or RETURN to your main program. See back page for an example that this routine can accomplish.

If you have'nt a HI-RES picture then you can use the one from last issue, the ROM INVVERSE CHAR. SET which will do nicely. Add the Sideways Sub-Routine to it with the changes listed below and you'll have your sideways picture.

```
1500 GOSUB 15060
15160 RETURN

15000 '*********************************************
15010 '* HI-RES SIDEWAYS COPY PRINT-OUT SUBROUTINE  *

12 — ZERO POWER RAM BY JOE LEON

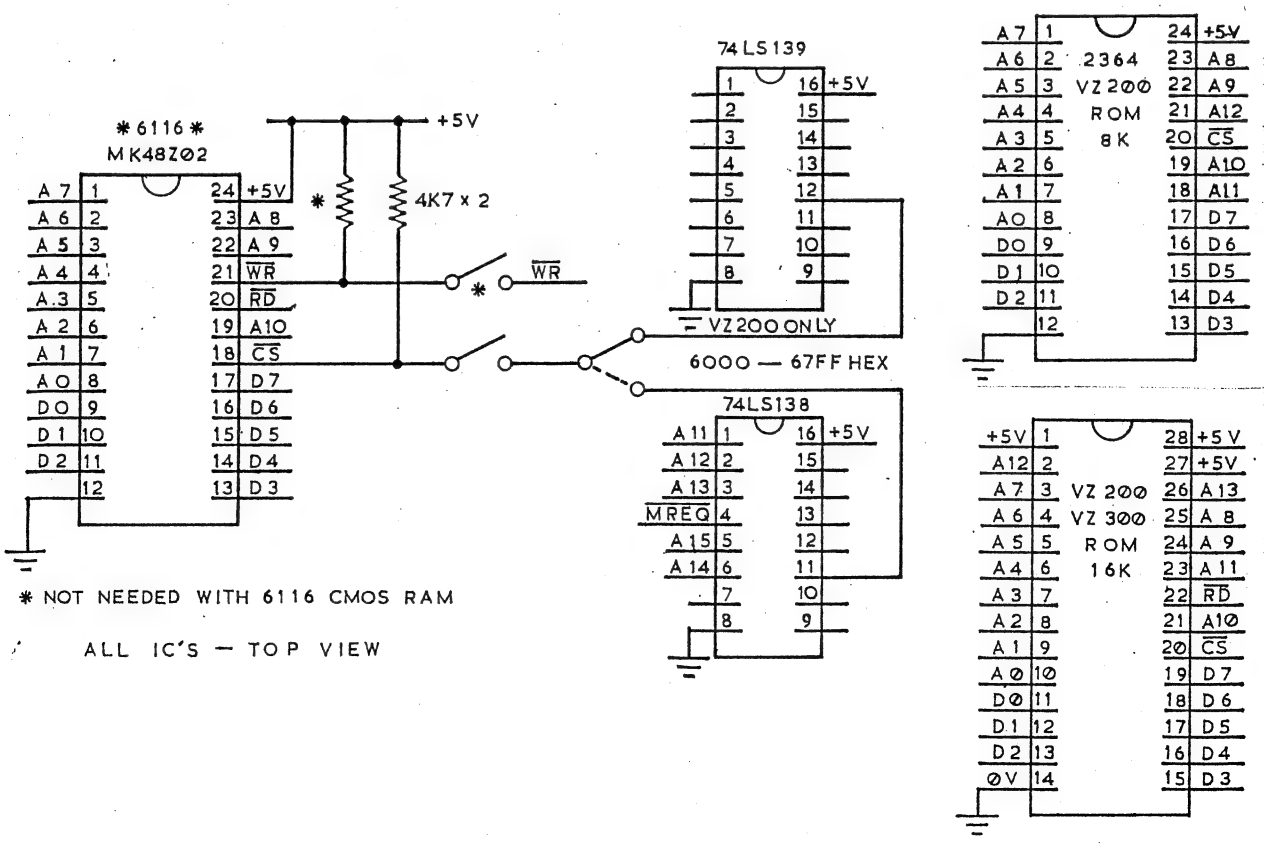
This B.B.RAM project uses the MK48Z02 2K ZERO POWER RAM with built in batteries. It's much simpler to construct than our previous B.B.RAM project. Only 2 Switches and two Resistors are needed. If you have a VZ200 then you can get a CS signal from the internal 74LS139, otherwise a 74LS138 decoder chip is needed. Like the previous project it is designed for the 6000-67FF HEX range. My thanks to Dave Boyce for letting us use the 74LS138 decoding circuit again, thanks Dave.

The easiest way to construct is to piggy back it on an 8K or 16K ROM inside the VZ200/300 or you may prefer to use your own construction methods. The piggyback method of construction is much simpler as most of the connections to the Address and Data buses are automatic when you piggy back. The pinouts of both ROMS are shown. As usual take care as mistakes are easy to make. The reason for the CS switch is that if you have a CART.W.P. then you can switch out the B.B.RAM so the CART.W.P. will work.

I must warn you, the MK48Z02 is expensive at $34.50. You may prefer an ordinary 6116 CMOS 2K RAM at around $4.00 which is pin compatible with the MK48Z02. The choice is yours. If you use a 6116 2K RAM then the WR (WRITE) switch and pull up resistor are not needed and of course you lose any routines stored there when power is switched off, but not with the MK48Z02.

You might ask what use can I put it to. One use is to put Dave Mitchell's Extended DOS in there after first purchasing it of course. See article and ad. elsewhere in this issue. Other utilities that could go there could be Monitors, Extended Basics, Etc. The MK48Z02 is ideal to develop your routines in as you can write and erase as often as you like. When debugged the MK48Z02 can simply be unplugged and put in an Eprom Programmer/Copier for transfer to Eprom.

NOTE :- With the WRITE Switch open the MK48Z02 behaves like an Eprom as you no longer can WRITE to it, only READ. Battery life is estimated at around 3 to 10 years after which it behaves like a normal CMOS RAM.



EXTENDED DOS VERSION 1.0 (C) - COPYRIGHT - DAVE MITCHELL - 1987

COMMANDS :-

MERGE - MERGES basic file from disk with program in memory.

DIRA - See example - T:MENU B:PATCH3.1 B:WORDPROC
B:EXTDOS E B:EXTDOS R W:DOS-INST
LDIRA - As above, but to screen and printer.

DIRB - See example - T:MENU 01 00 7AE9 801B 0532
B:PATCH3.1 01 0B 7200 771F 051F
LDIRB - As above, but to screen and printer.

STATUSA - Prints free disk space to screen on one line.
LSTATUSA - As above, but to screen and printer, see below.
534 RECORDS FREE 63.500K FREE

OLD - Restores a program after using the NEW command.

OLD. - Prints START, END and LENGHT of program in memory in HEX.

DEC XXXXX - Converts DECIMAL to HEX

HEX XXXX - Converts HEX to DECIMAL

STATUSA and LSTATUSA also works with Version 1.0 DOS.

The EXTENDED DOS is available in the two versions below :-

EXTDOS R - T.O.M. SEEKING
EXTDOS E - FOR 2K RAM AT 6000-67FF HEX

Price - $10.00 each or the two for $15.00. Availble from :-

Dave MITCHELL - (079) 27 8519 24 ELPHINSTONE STREET
NORTH ROCKHAMPTON QUEENSLAND 4701

NEWCASTLE AREA :- Joe LEON - (049) 51 2756
22 DRURY STREET WALLSEND N.S.W. 2287

BRIEF USER REPORT by Joe LEON :-

The above utilities work with both V1.0 and V1.2 DOS. At long last V1.0 DOS owners can have a STATUS command. The best thing about EXTDOS R/E is they extend the operating system and if you have a 2K ZERO POWER RAM at 6000-67FF HEX like I have then all above commands are available at power up.

EXTDOS R/E is one of these utilities that once used you don't want to be without. Like any utility it can be improved, certainly not the existing commands, but by adding more. Dave Mitchell sure has done a nice job on it.

DIRA and DIRB are my favourites. The first one displays over 45 files on the screen while the second one gives lots of information on your disk files.

If you read the Zero Power article in this issue it will inform you how to install a 2K CMOS 6116 or ZERO POWER RAM at 6000-67FF HEX so you too can enjoy EXTDOS E.

The program WORDS interprets the WORD TABLE in VZ ROM byte by byte, displaying the entry for each word on a separate line. The address on the left of each entry is the start address of the word in the WORD TABLE, followed by the token code for the word, then the bytes that make up the word. Adjacent to each byte is the character for which that byte is the ASCII code, the first byte of each word being in inverse form to mark the start of a new word. No ASCII interpretation of the zeroes replacing those words that were decommissioned in the VZ is possible or meaningful. Those bytes stand alone.

Press SPACE to freeze the display; press SPACE to continue.

The WORD TABLE still contains locations, in obliterated form, for all the TRS-80 computer's DISK WORDS in the order of their token codes. TRS-80 disk processing routines are not in the VZ ROM. They were not in the TRS-80 ROM either, but were loaded into RAM from disk on startup. In this respect the VZ disk controller with inbuilt ROM DOS is much more convenient.

With this article is a list of all the TRS-80 disk words and relevant data. With the exception of FN, INSTR and TIME$, each of these disk words has an entry in one of two POINTER TABLES. Each pointer consists of a pair of ROM memory cells containing an address in LO HI format (address = LO + HI x 256) and the pointers are in the same sequence in the POINTER TABLES as the corresponding words in the WORD TABLE.

One of the POINTER TABLES begins at address 6178 and contains pointers for all the words with tokens from 128 (END) to 187 (NEW). The other TABLE begins at address 5640 and contains pointers for all the words with tokens from 215 (SGN) to 250 (MID$). Words with tokens from 188 (TAB() to 214 (<) do not have entry to either of the POINTER TABLES.

The address in each pointer is the start of the routine dedicated to processing statements involving the associated word. Since there are no processing routines in VZ ROM for TRS-80 disk words, to what do their pointers point? With the exception of SYSTEM, which points to address 0 (effectively a restart command), and the three words with NO ADDRESS LIST, each disk word points to an address in the COMMUNICATIONS REGION in RAM memory. If you look at the listing, starting from CVI (token 230) and going down to MKD$ (and inserting DEF, token 176, between CVS and CVD) then jumping to CMD (token 133) at the top of the listing and proceeding down, you will see how most of the addresses in the pointers increment by three. There is a gap between KILL and LSET and between RSET and SAVE and between CVI and CVS. Every one of these triples of cells in the communications region (including the triples that fill the gaps just mentioned) contains the same three bytes, which constitute a machine code JUMP instruction (JP 301).

So, if you insert the token for any one of these disk words into a basic program, the basic interpreter will look up the corresponding pointer in the appropriate POINTER TABLE, go to the address in the communications region indicated by the pointer, and execute the JP 301 instruction it finds at that address. Address 301 is the start of a DOS error message routine and so program RUN will terminate with display of the disk error message.

Perhaps the people who designed the VZ200 had it in mind to use these disk words and tokens for VZ disk commands when they got around to marketing a disk drive for the VZ. But, when they eventually designed the VZ DOS, changed their mind and simply set up new tables in the disk controller memory (and so VZ disk words are not tokenised).

Which leaves 23 vacated positions in the WORD TABLE and 23 corresponding pointers in the POINTER TABLES, and more than 23 triples of reserved memory cells in the communications region, all completely unused.

Because all these JP 301 instructions are in RAM, they can be POKE changed to any addresses in memory you please: the first byte of each triple ('195') is the JP instruction; bytes two and three are the address (currently 301) in LO HI format to which the jump is made. If you make up your own machine code routine, POKE the start address of that routine in one of these triples so as to make a JUMP-to-that-address instruction, you can then use the corresponding token in your basic programs (using DLINE) to call and execute your routine. With 23 free tokens, that's a lot of routines you can set up in your VZ.

16 — MAKING C.W.P. WORK BY JOE LEON

The C.W.Processor will not work with the SUPER II VZ200 (34K RAM) or VZ300 18K Memory Expansion (INTERNAL) as per Technical Report issue 3 of VZ Journal. It will also not work if any RAM (2K) is active at 6000-67FF HEX. VZ owners with the MAGIC EPROM fitted should have no problems as they can switch it out easily if it does'nt work with C.W.P. unless they have extra RAM fitted like I have. So far I have'nt had time to modify my spare VZ with the Magic Eprom. The C.W.P. needs at least 12K of unused Address Range from D000 to FFFE HEX and 2K at 6000 to 67FF HEX to become operational. This article explains how to free the address range needed.

SUPER II VZ200 MODIFICATIONS :-

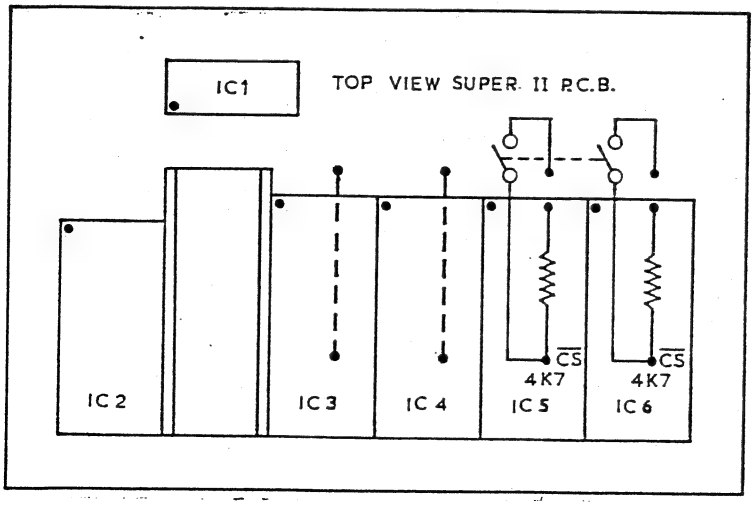
If you study the diagram you will realise the mod. is a simple one, just a couple of pull up resistors and a switch is all that's needed. The CS (Chip Select) line on IC 5 and 6 must be modified as shown. With the switch in the open position both IC 5 and 6 are deactivated allowing the C.W.P. to operate. Make sure the power is off when using the switch.

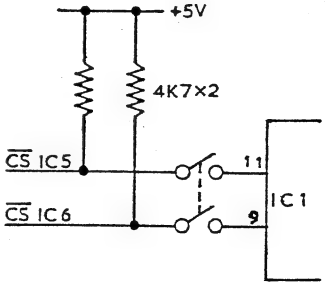
Remove IC 5 and 6 from the board. Next the middle of the sockets have to be cut out so you can remove the two Link Wires. Drill two small holes in the 5V track which is easy to find. It runs under pins 1 and 28 of IC's 3 to 6. Fit the resistors and switches as shown. The switch can be a DPST, DPDT or a Dip Switch. In my case I used a four way Dip Switch which allows me to switch out IC'S 4 to 6 and Zero Power Ram at 6000-67FF HEX. One benefit of being able to switch out the Rams singly is that it allows me to test out VZ200/300 16K Ram Expansion cartridges. The alteration shoud'nt present any problems as it's a simple one.

VZ owners with extra internal RAM get a bonus with the C.W.P. by way of an extra 2K for text after having switched out the top 16K first. EG :-

VZ200 . . . . . = 5324 Bytes free for text.
VZ300 . . . . . = 15564 Bytes free for text.
VZ200 Super II - 24K = 9420 Bytes free for text.
VZ200 Super II - 16K = 17612 Bytes free for text.

If you have any Ram or Eprom at 6000-67FF HEX it will also have to be deactivated using the same procedure as with Super II. See the Zero Power Ram article in this issue on how to do it.





This new single W.P. Patch supercedes our previous one. It has full compliment of DISK COMMANDS while retaining all TAPE FUNCTIONS. Unlike the earlier version it's childs play to convert your E & F TAPE W.P. It's simply a matter of transfering your TAPE W.P. to the same DISK as the W.P. Patch and BRUNning the Patch which BLOADS your transfered TAPE W.P. To facilitate transfering your E & F TAPE W.P. to DISK a TAPE to DISK transfer program is provided with the W.P. Patch.

As you'll notice from the MENU it will SAVE or LOAD to or from TAPE or DISK allowing you to transfer all your TAPE W.P. Files to DISK or back to TAPE again. It can be used with 1 or 2 DRIVES. Below are the two Menus.

```
VZ-WORD PROCESSOR              VZ-WORD PROCESSOR
================               ================

  E)DIT TEXT                     L)OAD
  C)LEAR TEXT                    S)AVE
  P)RINT TEXT                    D)IR
  L)OAD FILE                     E)RA
  S)AVE FILE                     R)EN
  V)ERIFY FILE                   I)NIT
  Q)UIT PROGRAM                  1-2) DRIVE 1

ENTER COMMAND >                ENTER COMMAND >

15042 CHARACTERS FREE          15042 CHARACTERS FREE
```

Dave has done an exellent job with his latest version and the only thing lacking is some fancy printer commands which may be incorporated in a future version.

I've used this and previous W.P. Patches in the compilation of the Journal and the results speak for themselves. When using SAVE, LOAD, REN and ERA upper or lower case letters can be used which makes it easy to back up files using the same file name. Lower case file names are not visible to the normal DIR command but are from within the W.P.

NOTE :- This W.P. Patch is not compatible with the Cartridge Word Processor TAPE or DISK Files or Quickwrite Disk Files. It is possible to transfer Tape Files to Quickwrite though.

SYSTEM REQUIREMENTS :-

DISK DRIVE plus V1.0 or V1.2 Disc Controller
VZ300 plus 16K RAM PACK or
VZ200 plus 18K (16K RAM PACK + 2K) (Minimum)

The price is $10.00 which includes Post/Packing and full instructions and is available from :-

HUNTER VALLEY VZ USERS' GROUP
P.O.BOX 161 JESMOND 2299
N.S.W. AUSTRALIA Phone (049) 51 2756

If you allready have D.SMITH'S E & F Tape Word Processor and recently purchased a Disk Drive then just for $10.00 Dave Mitchell's W.P.Patch will convert it for full DISK use as well and be much cheaper than buying a new Word Processor.

20 — MODIFYING AEM4505 BY D.BOYCE

AEM 4505 and the VZ 200/300 and Notes to Date (22-3-87). Refer to June/July 1986 issues of Australian Electronics Monthly.

1> Jumpers for USER selectable options
Links U,V,W & X 'should be made'.

2> The I/O Select Link should be made as indicated by the Dotted Line. EG. Pin 11 of IC5 to be joined to the Junction of IC11 pins 8 & 11.

3> All IC's including the 6116 Ram, EXCEPT for IC's 1,2,3 & 9 to be installed.

4> RV1 - the Volume control. Use a Panel mount 10K ohm Lin pot. Dick Smiths R-1806 or R-6806. - Reset sw - D.S.E S-1198. Install Socketts UNDER ALL IC's.

5> Locate the 'PARALLEL PORT' on the top picture on page 88 of AEM June 1986. This picture is the Component Overlay. The P.Port is next to the 'Fingers' which plug into an IBM/Clone. The figure A1 refers only to the Fingers.

The P.Port is numbered 1 to 13. The Front Row of pins (nearest the fingers) carry the Signals and match up with the Centronic/Parallel Port numbers on the VZ Printer Interface Plug.

The GND (earth) can be connected to pin B10 or pin B31 of the IBM fingers (it also appears on pin xx (I cannot tell from the pictures) of the P.Port). You will be able to find which Pin when You buy your P.C.Board, See also fig.3 and Table 2 on page 52 of JULY '86 AEM.

The Printer Interface is used for Interfacing to the Speech Synth. A suitable Power Supply such as the Datasette or Plotter should be used to power the Speech Synth.

NOTES :- This Speech Synthsiser is much easier to use than the one (write-up) which appeared (by myself) in H.V.V.Z.U.G 's Magazine/Journal No#1.

The SPO-256-AL2 chip , LM386 Amplifier chip , the 7805 REGulator and the Interconnecting cable with Centronic's Sockett can be removed from my Speech Synth and used in this (AEM4505) Speech Synthsiser. I also suggest that the Volume control be mounted 'OFF' the Circuit board and ON the front of the Case that you are using.

In the next issue I will show how to incorporate Tone controls as used on my Original Speech Synth. This is relatively easy.

A suit of PUBLIC DOMAIN Programs for the AEM4505 to RUN on the VZ200/300 are available from the H.V.V.Z.U.G or myself.

DAVE BOYCE 41 HEATHER DRIVE CHRISTIE DOWNS 5164 South Aust.

Cover Note - I wrote to AEM some time ago (about 2 months) requesting permission to use 'Parts of' their Diagrams. I haven't heard back from them ?? Considering that if you buy Your CTS chip from tandy's like I did, You will see that the diagrams supplied with their chip are for all Intents and Purposes the same as AEM's.
